Peptide purchase decision

Columbus, Ohio | researched 2026-10-10 | prices as seen that day

Buy from: Koi Peptides (Koi Research Labs LLC) koipeptides.com

PROVISIONAL: only if every gate below passes

Ships from: unnamed "US warehouses" (registered agent in Sheridan, WY). **Transit to Columbus:** about 3-5 business days; same-day dispatch if ordered Mon-Fri before 2 PM ET.

Why: stronger of the two vendors selling water on the same site: every product has its own Freedom Diagnostics COA accession, while runner-up Kylo stamps one lot on 6+ compounds. Unconfirmed: live checkout, Ohio shipping, BPC-157 10 mg listing, per-component blend COA. Transparency 5/10.

BUY EXACTLY THIS (12-WEEK COURSE)

Item	Exact product name and size (COA accession, HPLC purity)	Qty	Unit	Line total
GHK-Cu	GHK-Cu 50mg & 100mg - Copper Tripeptide, **50 mg** (2605290222, 99.96%)	3	$39.95*	$119.85
BPC-157	BPC-157 5 & 10mg, **10 mg** (2604060200, 99.283%; listing not yet seen)	5	$59.95*	$299.75
TB-500	TB-500 (Thymosin Beta-4) 10mg, **10 mg** (2512290134, 99.127%; Dec 2025 lot)	5	$59.95	$299.75
CJC-1295 no DAC + Ipamorelin	CJC-1295 No DAC + Ipamorelin Blend 10mg, **5 mg + 5 mg** (2604060224, 99.928%; fallback blend, replaces both singles)	3	$79.95	$239.85
Bacteriostatic water	Bacteriostatic Water for Peptide Reconstitution, **10 mL** (2604030180; 2 vials per 28-day block)	6	$19.95*	$119.70
			Subtotal	$1,078.90
			Shipping (free over $200; optional cold pack extra, recommended)	$0.00
			Estimated total, before Ohio sales tax (plausible range $1,060-$1,150)	**$1,078.90**

* price inferred from a page range; confirm in cart. **Water and syringes:** Koi's water is labelled "not for human injection"; USP bacteriostatic water from a pharmacy is safer (drop $119.70). Koi sells no syringes: get U-100 0.3 mL insulin syringes, 3 mL mixing syringes, swabs and a sharps bin at a Columbus pharmacy.

WHY THIS VENDOR

- **Per-product COAs:** each product has a distinct Freedom Diagnostics accession, searchable at koipeptides.com/coa/; HPLC 99.1-99.96%; TB-500 shows LC-MS identity and net 9.97 mg.
- **Beats Kylo, narrowly:** Kylo puts lot SD-260728-1 on 6+ compounds, relies on a weak lab (Optiq, 2/10) for TB-500 and ipamorelin, and shows "COA coming soon" on current batches.
- **Same-site water and fast shipping:** standalone 3/10 mL water; same-day dispatch, 3-5 day transit, free over $200; no FDA warning letter found.
- **Gaps:** one lab only (Freedom, 4/10, no ISO 17025 found); no Finnrick or TitrateLab data; no endotoxin value seen for any lot; Koi's own lot IDs are not published.
- **Red flags:** unverified Trustpilot claims of a relabelled COA and non-working QR codes; PeptIQ 65, "Mixed signals"; an overfill report; BPC-157 purity differs between pages.

SEPARATE VIALS, NOT A STACK

Buy GHK-Cu, BPC-157 and TB-500 as single vials, one lot per peptide for the whole course. Koi sells no standalone CJC-1295 no DAC, so its 1:1 5/5 mg blend is the only acceptable fallback, and only if its lot PDF gives MS identity, quantity and purity per component plus endotoxin; if not, switch vendor. Reject GLOW, KLOW, Wolverine (BPC/TB) and the GLOW Stack.

RUNNER-UP

Kylo Peptides (kylopeptides.com, transparency 4/10). If Koi fails a gate, go first to **Panda Peptides** (all five as true singles, about $700-$770, pharmacy water); use Kylo only if water must come from the same site (buy its CJC + IPA Stack, $99.95, separate vials).

BEFORE YOU ORDER

- **Go/no-go gates:** checkout accepts a 432xx address; BPC-157 10 mg is listed; Koi emails full PDFs for the shipping lots (chromatogram, MS mass, net content, endotoxin in EU) and confirms one lot per peptide in writing. Masses: GHK-Cu ~402, BPC-157 ~1,419, TB-500 frag. ~889, CJC no DAC ~3,368 (DAC is ~3,647), ipamorelin ~712 Da.
- **Legal status:** research-use-only; none of the five is FDA-approved; no lawful injectable route today. FDA letters (Mar, Jun, Aug 2026) treat vendor-sold water as evidence of human-use intent. Lawful GP options: topical GHK-Cu (503A pharmacy); sermorelin or tesamorelin for CJC/Ipa.
- **On arrival:** look up each accession at freedomdiagnosticstesting.com (client must read Koi); match the lot printed on each vial to its COA, and raise any unlabelled vial before use. Unopened vials frozen, mixed at 2-8 C; discard 28 days after first puncture.
- **GP sets dosing:** doses in mcg and syringe units; stagger starts, one agent every 5-7 days. Baseline IGF-1, HbA1c, BP, copper and ceruloplasmin; review at 4 weeks; stop on high IGF-1, rising glucose, oedema, infection or cloudy GHK-Cu.
- **Water:** pharmacy USP bacteriostatic water (GP prescription) is safer; if you accept it, Panda (6/10) outranks Koi.
- **Keep the first order small:** 8 weeks costs about $679.30 (GHK-Cu 2, BPC-157 3, TB-500 3, blend 2, water 4), given FDA enforcement waves and vendor closures. Pay by credit card; no refund policy found.

Evidence quality: search-verified, not page-verified (no COA PDF opened, no lab lookup, no live checkout; Koi site status unknown; three prices inferred). **Confidence: low.** Background: research/01 to 06 in the repo.
